
Toolkit Box

This toolkit box has been created within the framework of the Datemats project. The aim of this tool is to be used as a container tool by any company or practitioner to facilitate the understanding and application potential of emerging materials and technologies (EM&Ts).

Datemats project is the author of the container and layout of this toolkit. During the project's lifetime, 20 boxes have been developed with their specific four EM&Ts and materials samples (Advanced Growing, ICS Wearables, Nanomaterials, Wood-Based) with the purpose to test and showcase examples of what this tool can offer. All this information is featured on the project's website.

Moreover, as an output of an European project it is the intention and will of its creators to foster its use and dissemination at large scale as an open source tool.

It is important to stress that all specific content collected in the subsequent versions of the toolkit that the stakeholders may introduce will not be related in any manner to the results of the Datemats project.
